

# THXtender preparation kit

The THXtender is an excavator preparation kit for transforming an excavator into an efficient harvester. The kit consists of our harvester head (TH65, TH75 or TH75X), an extender boom with bucket and the TOC-MD measuring device.

## THXtender boom

The THXtender boom makes your excavator harvester more versatile and complete. The bucket at the end of the THXtender boom improves the maneuverability of the excavator. The bucket can be used for smaller earthmoving tasks, such as moving stones and levelling the terrain. You can also use the bucket for pulling and pushing the machine in difficult terrain, or use it as support when you want to make a sharp turn or cross a ditch. The boom gives you almost 3 m longer reach, which will also improve the production of the machine. When using the bucket or moving the machines longer distances, you grab the boom with the harvester head, so that the head will not swing. Thus you can drive the excavator faster in terrain. The hoses leading to the harvester head are well protected inside the boom.

## Work flexibly

Many features make TOC-MD simply better. The TOC-MD measuring device continuously optimises bucking and cutting window search. The patented automatic pre-delimbing together with the traction control and power delimbing guarantee a high quality end result. The innovative sequence mode and flexible automation levels help the operator gain higher productivity. The sequences adapt to the work phases, giving the operator freedom to interfere with the operation and then continue the sequence. TOC-MD is the optimum choice for all conditions.

## Technical specifications

Excavator	18–25 t
Total length	4000 mm
Reach	2800 mm
Weight	650 kg
Bucket width	500 mm
Recommended Logset harvester heads: TH65, TH75, TH75X
